

# iMKT loading data

## iMKT PopFly and PopHuman data

PopFly and PopHuman are. The package include functions to download all genes statics of all populations located in these genome browsers. Here we will explain how to load this information in your working enviroment and how to access it in order to use it efficiently!

### Loading the row data

Remember you are downloading gene information of 20ypico *Drosophila melanogaster* populations and 26 Human populations. This procces could take a while!

```
library(iMKT)
dataPopfly<-loadPopFly()
#> Loading PopFly data into your workspace.
#> This process may take some seconds to complete, please be patient.
knitr::kable(head(dataPopfly))
```

Pop	Name	Start	End	Chr	p0	pi	d0	di	m0	mi	alpha	fisher_pval	DoS	K

The data is presented at the most compress form in a simple dataframe. Each gene were analyzed by populations and contains information about segreating, divergent and analyzed sites, in addition to the Standard MKT calculation, Direction of Selection, Ka/Ks, and the Derived Allele Frequency (P0). The same information is provided by selected sites (Pi). If you have some basics R knowledge, you can access manually to the diverse gene information manually, in order to perform the test individually, by recombination information or concatenating them.

As we compress the Derived Allele Frequency in a column field, you will need to create the correct variables forms to pass them properly at the functions. It can be done in a few R basics lines!

```
## Preparing RAL Adh
adhRAL<-dataPopfly[dataPopfly$Name=='FBgn0000055' & dataPopfly$Pop=='RAL',]

adhRAL$DAF0f <- as.character(adhRAL$DAF0f); adhRAL$DAF4f <- as.character(adhRAL$DAF4f)
adhRAL0f<-unlist(strsplit(adhRAL$DAF0f, split=";"))
adhRAL4f <- unlist(strsplit(adhRAL$DAF4f, split=":"))
adhRAL0f <- as.numeric(adhRAL0f); adhRAL4f <- as.numeric(adhRAL0f)

f <- seq(0.05,0.95,0.1)
mi <- adhRAL$mi; m0 <- adhRAL$m0
Di <- adhRAL$di; D0 <- adhRAL$d0

dafAdhRAL <- cbind(f, adhRAL0f, adhRAL4f); dafAdhRAL <- as.data.frame(dafAdhRAL)
names(dafAdhRAL) <- c("daf","Pi","P0")
divAdhRAL <- cbind(mi, Di, m0, D0); divAdhRAL <- as.data.frame(divAdhRAL)
```

This process could be tedious depending on the number of genes you want to analyze. To solve this, we just add the ***PopFlyAnalysis()*** function to the package. It allows you select a huge amount of genes and/or populations and retrieve the information easily! Remember to save the information in the most appropriate way to yours analysis or results!

```

PopFlyAnalysis(genes = c("FBgn0000055","FBgn0003016"),pops = c("RAL","ZI","FR"),recomb = F)
#> [1] "Population = FR"
#> Warning in check_input(daf, divergence, 0, 1): Input daf file contains P0 values = 0.
#> This can bias the function fitting and the estimation of alpha.
#> [1] "Population = RAL"
#> Warning in check_input(daf, divergence, 0, 1): Input daf file contains P0 values = 0.

```
